

# THEATRICAL SMOKE, FOG, AND HAZE TESTING

## CALIBRATION FACTORS

ENVIRON has developed a protocol for using a MIE PDR-1000AN aerosol monitor to measure concentrations of theatrical smoke, fog, and haze. The monitor measures the light scattering produced by particles in the air, and reports the results in terms of mass concentration (milligrams per cubic meter, or mg/m<sup>3</sup>) with the assumption that the particles in the air are a fine dust. Because different types of particles have different light scattering properties, the readings from the monitor need to be adjusted (or calibrated) when measuring something other than dust (such as fog droplets). The user converts the dust readings to the correct mg/m<sup>3</sup> readings for the fog droplets by multiplying the dust readings by a *calibration factor* for the particular fog fluid/fog machine combination being used for the fog, smoke, or haze effect.

The following calibration factors have been developed and approved by Equity and the League for use in measuring theatrical smoke, fog, and haze:

Approved Calibration Factors for Monitoring Theatrical Smoke, Fog, and Haze (updated September 2009)					
Manufacturer	Machine	Fluid	Fluid Type	Calibration Factor	Ref
CITC	Fantasy FX spray can	Fantasy FX Professional Haze	mineral oil	0.87	(20)

**Notes:**

- \* Due to monitor overloading during the calibration testing for the Ultratec (Le Maitre) G300/LSG-Molecular Fog Fluid combination, the resulting calibration factor of 4.95 is known to be overestimated. This value can be used as a conservative (i.e., health protective) screening value. If monitoring results using this calibration factor result in exposures exceeding the guidance levels, it is recommended that additional testing to refine this calibration factor be conducted.
